

Proven Program

Summary

Firming playing surfaces is dependent on allowing moisture to move through the top 2.5 centimeters (1 inch) soil profile while flocculating soil particles. Utilizing available calcium enhances this process.

Application Rates

- ▶ 20 l/Ha LiquaGyp
- ▶ 10 l/Ha Polyphosphite 30®, 0-0-27
- ▶ 5 l/Ha FloThru™ A-Plus

Irrigate for approximately 5 minutes to move into the soil.

Repeat every 14 days.

Utilize in conjunction with pHusion Calclitic Limestone or pHusion Gypsum

FIRMING-UP PLAYING SURFACES

LiquaGyp

- ▶ Delivers 100% available calcium that has an immediate impact on soil flocculation.

Polyphosphite 30®, 0-0-27

- ▶ Systemic potassium to mitigate sodium in the turf plant.
- ▶ Polyphosphite activates the turfgrass's natural defense mechanism.

FloThru™ A-Plus

- ▶ MAT acid solubilizes nutrients for plant uptake.
- ▶ Enhances calcium availability.
- ▶ Enhances moisture infiltration through the soil.

FAQ

Does this spray replace granular calcium application?

- ▶ No, this spray combination should be used in addition to balancing proper soil chemistry. This will provide firmer conditions quickly, but the effects may dissipate after 14 days.

MAT Acid Technology solubilizes nutrients in the top 5 centimeters of soil, making them readily available to the plant. MAT Acid lasts for 21-28 days, continuously solubilizing nutrients.
